

RDF (Resource Description Framework)

Fig. 1 An RDF graph with two nodes (Subject and Object) and a triple connecting them (Predicate)

Un triplet RDF est un statement RDF <*Sujet, Prédicat, Objet*>

- **sujet**, qui est une [IRI](#) ou une [blank node](#)
- **prédicat**, qui est une [IRI](#) (Nature de la relation entre sujet et objet)
- **objet**, qui est une [IRI](#), un [literal](#) ou une [blank node](#)

Le **prédicat** dénote une propriété (relation binaire).

Un ensemble de triplets RDF représente un graphe RDF où Sujets & Objets sont des nœuds du graphe RDF.

Il existe 3 types de nœuds:

1. IRIs (Quelque chose dans le monde → **ressource (static referent)**)
2. Literals (Quelque chose dans le monde → **ressource (constant literal value)**)
3. Blank nodes (Quelque chose existe dans la relation sans la nommer)

Vocabulaire RDF (RDFS language : Définition de vocabulaires pour définir les caractéristiques sémantiques des données RDF)

Class name	comment
rdfs:Resource	The class resource, everything.
rdfs:Literal	The class of literal values, e.g. textual strings and integers.
rdf:langString	The class of language-tagged string literal values.
rdf:HTML	The class of HTML literal values.
rdf:XMLLiteral	The class of XML literal values.
rdfs:Class	The class of classes.
rdf:Property	The class of RDF properties.
rdfs:Datatype	The class of RDF datatypes.
rdf:Statement	The class of RDF statements.
rdf:Bag	The class of unordered containers.
rdf:Seq	The class of ordered containers.
rdf:Alt	The class of containers of alternatives.
rdfs:Container	The class of RDF containers.
rdfs:ContainerMembershipProperty	The class of container membership properties, rdf:_1, rdf:_2, ..., all of which are sub-properties of 'member'.
rdf>List	The class of RDF Lists.

Property name	comment	domain	range
rdf:type	The subject is an instance of a class.	rdfs:Resource	rdfs:Class
rdfs:subClassOf	The subject is a subclass of a class.	rdfs:Class	rdfs:Class
rdfs:subPropertyOf	The subject is a subproperty of a property.	rdf:Property	rdf:Property
rdfs:domain	A domain of the subject property.	rdf:Property	rdfs:Class
rdfs:range	A range of the subject property.	rdf:Property	rdfs:Class
rdfs:label	A human-readable name for the subject.	rdfs:Resource	rdfs:Literal
rdfs:comment	A description of the subject resource.	rdfs:Resource	rdfs:Literal
rdfs:member	A member of the subject resource.	rdfs:Resource	rdfs:Resource
rdf:first	The first item in the subject RDF list.	rdf>List	rdfs:Resource
rdf:rest	The rest of the subject RDF list after the first item.	rdf>List	rdf>List
rdfs:seeAlso	Further information about the subject resource.	rdfs:Resource	rdfs:Resource
rdfs:isDefinedBy	The definition of the subject resource.	rdfs:Resource	rdfs:Resource
rdf:value	Idiomatic property used for structured values.	rdfs:Resource	rdfs:Resource

<code>rdf:subject</code>	The subject of the subject RDF statement.	<code>rdf:Statement</code>	<code>rdfs:Resource</code>
<code>rdf:predicate</code>	The predicate of the subject RDF statement.	<code>rdf:Statement</code>	<code>rdfs:Resource</code>
<code>rdf:object</code>	The object of the subject RDF statement.	<code>rdf:Statement</code>	<code>rdfs:Resource</code>

A partir de cette base, on peut définir un nouveau vocabulaire:

Construct	Syntactic form	Description
<code>Class</code> (a class)	<code>C rdf:type rdfs:Class</code>	<code>C</code> (a resource) is an RDF class
<code>Property</code> (a class)	<code>P rdf:type rdf:Property</code>	<code>P</code> (a resource) is an RDF property
<code>type</code> (a property)	<code>I rdf:type C</code>	<code>I</code> (a resource) is an instance of <code>C</code> (a class)
<code>subClassOf</code> (a property)	<code>C1 rdfs:subClassOf C2</code>	<code>C1</code> (a class) is a subclass of <code>C2</code> (a class)
<code>subPropertyOf</code> (a property)	<code>P1 rdfs:subPropertyOf P2</code>	<code>P1</code> (a property) is a sub-property of <code>P2</code> (a property)
<code>domain</code> (a property)	<code>P rdfs:domain C</code>	domain of <code>P</code> (a property) is <code>C</code> (a class)
<code>range</code> (a property)	<code>P rdfs:range C</code>	range of <code>P</code> (a property) is <code>C</code> (a class)

Exemple:

```
<Bob> <is a friend of> <Alice>.
```

Avec pour définition de "is a friend of" comme suit:

```
<Person> <type> <Class>
<is a friend of> <type> <Property>
<is a friend of> <domain> <Person>
<is a friend of> <range> <Person>
<is a good friend of> <subPropertyOf> <is a friend of>
```

Entailment regime / Extensions sémantiques

Donc de nouveaux vocabulaires sont possibles avec différents types de raisonnements associés (règles d'inférence à définir). Quand un type de raisonnement se trouve être utile pour beaucoup d'applications différentes ce type de raisonnement peut être documenté comme "entailment régime" [SPARQL11-ENTAILMENT] et [RDF11-MT]. Par exemple, RDFS est un entailment régime (ou une extension sémantique de RDF)

Graphes RDF multiples

RDF datasets (RDF 1.1) → Une collection de graphes RDF. Permet de travailler avec plusieurs graphes RDF tout en conservant leur contenu séparé.

- Un seul "default graph" (étant lui-même un graph RDF) **sans nom**
- Zéro ou plusieurs graphes nommés (qui sont des paires IRI/blank node ↔ graphe RDF). Les noms des graphes nommés sont uniques à l'intérieur d'un dataset.

Seul un de ces graphes a une IRI / blank node → **Graphes nommés**.

L'IRI ou blank not correspond au nom du graphe.

Note : SPARQL ne supporte pas des graphes RDF identifiés par des blank nodes.

Un triplet RDF encode un statement (expression logique) → un graphe RDF est une conjonction (ET logique) de ses triplets.

Relations entre graphes RDF:

1. **Implication** : A implique B, si A est vrai alors B est vrai aussi
2. **Équivalence** : A = B si A implique B et B implique A
3. **Inconsistance** : Le graphe contient une contradiction interne (Ne peut jamais être vérifié).

RDF literals datatypes

Core types	xsd:string	Character strings (but not all Unicode character strings)
	xsd:boolean	true, false
	xsd:decimal	Arbitrary-precision decimal numbers
	xsd:integer	Arbitrary-size integer numbers
IEEE floating-point numbers	xsd:double	64-bit floating point numbers incl. ±Inf, ±0, NaN
	xsd:float	32-bit floating point numbers incl. ±Inf, ±0, NaN
Time and date	xsd:date	Dates (yyyy-mm-dd) with or without timezone
	xsd:time	Times (hh:mm:ss.sss...) with or without timezone
	xsd:dateTime	Date and time with or without timezone
	xsd:dateTimeStamp	Date and time with required timezone (RDF 1.1)
Recurring and partial dates	xsd:gYear	Gregorian calendar year
	xsd:gMonth	Gregorian calendar month
	xsd:gDay	Gregorian calendar day of the month
	xsd:gYearMonth	Gregorian calendar year and month
	xsd:gMonthDay	Gregorian calendar month and day
	xsd:duration	Duration of time (RDF 1.1)
	xsd:yearMonthDuration	Duration of time (months and years only) (RDF 1.1)
	xsd:dayTimeDuration	Duration of time (days, hours, minutes, seconds only) (RDF 1.1)
	xsd:byte	-128...+127 (8 bit)
	xsd:short	-32768...+32767 (16 bit)
Limited-range integer numbers	xsd:int	-2147483648...+2147483647 (32 bit)
	xsd:long	-9223372036854775808...+9223372036854775807 (64 bit)
	xsd:unsignedByte	0...255 (8 bit)
	xsd:unsignedShort	0...65535 (16 bit)
	xsd:unsignedInt	0...4294967295 (32 bit)
	xsd:unsignedLong	0...18446744073709551615 (64 bit)
	xsd:positiveInteger	Integer numbers >0
	xsd:nonNegativeInteger	Integer numbers ≥0
	xsd:negativeInteger	Integer numbers <0
	xsd:nonPositiveInteger	Integer numbers ≤0
Encoded binary data	xsd:hexBinary	Hex-encoded binary data
	xsd:base64Binary	Base64-encoded binary data
Miscellaneous XSD types	xsd:anyURI	Absolute or relative URIs and IRIs
	xsd:language	Language tags per [BCP47]
	xsd:normalizedString	Whitespace-normalized strings
	xsd:token	Tokenized strings
	xsd:NMTOKEN	XML NMTOKENs
	xsd:Name	XML Names
	xsd:NCName	XML NCNames

OWL (Ontologie)

Utilisé pour processor des informations contenues dans des documents plutôt que juste les présenter aux utilisateurs.

- RDF** : Modele de donnée pour des ressources et les relations entre elles.
- RDFS** : Vocabulaire pour décrire les propriétés et les classes des ressources RDF
- OWL** : Ajoute plus de vocabulaire pour décrire les propriétés et les classes (relations entre classes, cardinalité, égalité,...). OWL-Full permet

3 sous-langages:

- OWL-Lite** : Hiérarchie de classification (taxonomie) et contraintes simples
- OWL-DL** : Expressivité max avec les caractéristiques de décidabilité (tous les calculs sont garantis d'être terminés en temps borné) et de completion (toutes les conclusions sont calculables). Utilisation des constructions du langage OWL avec certaines restrictions.
- OWL-Full** : Expressivité max + liberté syntaxique de RDF (Sans les caractéristiques de décidabilité et de completion). Permet d'augmenter la signification des vocabulaires prédéfinis (RDF/OWL). Il y a cependant peu de chance qu'un raisonneur puisse raisonner sur toutes les features de OWL-Full.

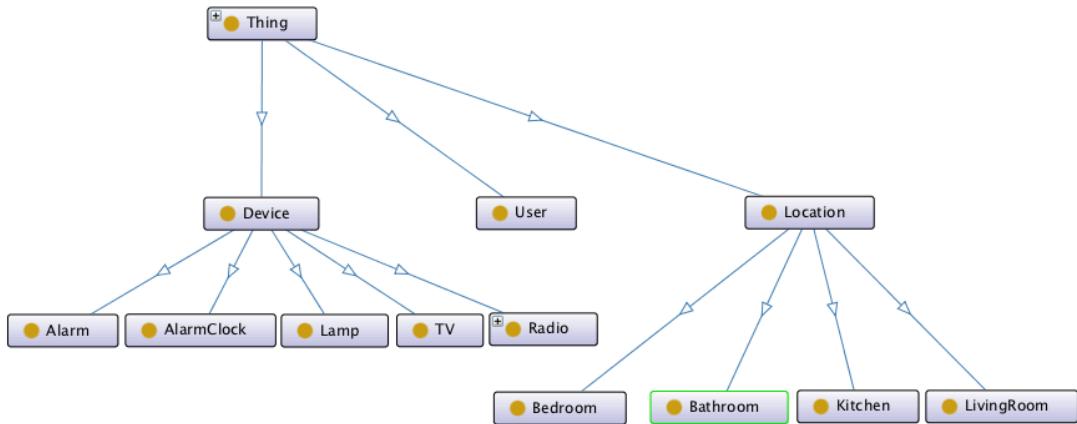

Eléments de langage OWL-Lite

Représentation temporelle à partir de l'approche 4D-Fluents généralisée

On suit l'approche présentée ici (Context slices):

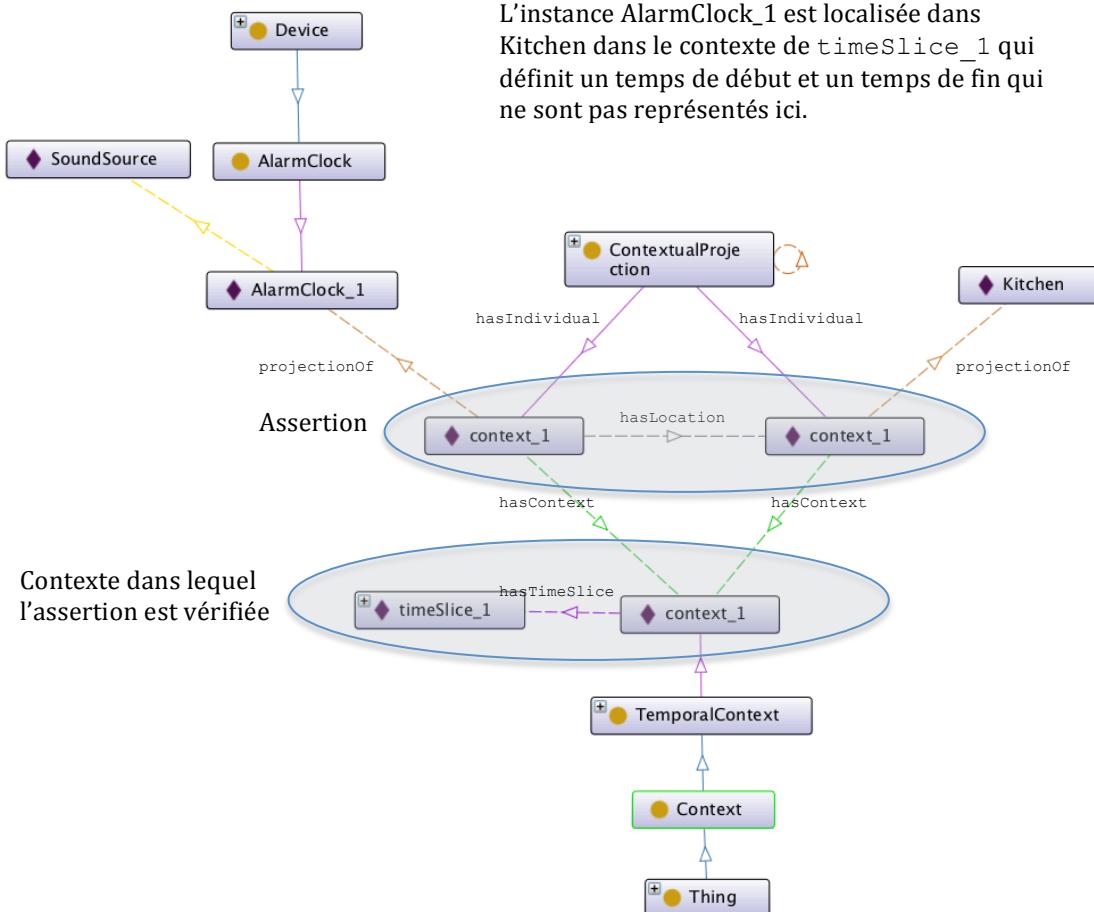

http://ontologydesignpatterns.org/wiki/Submissions:Context_Slices

On définit une ontologie de gestion des contextes qui va être utilisée dans notre ontologie:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE rdf:RDF [
  <!ENTITY owl "http://www.w3.org/2002/07/owl#">
  <!ENTITY rdf "http://www.w3.org/1999/02/22-rdf-syntax-ns#">
  <!ENTITY rdfs "http://www.w3.org/2000/01/rdf-schema#">
  <!ENTITY xsd "http://www.w3.org/2001/XMLSchema#">
]>
<rdf:RDF xml:base=""
  xmlns:owl="&owl;" 
  xmlns:rdf="&rdf;" 
  xmlns:rdfs="&rdfs;">
<owl:Ontology rdf:about="">
  <rdfs:label xml:lang="en">Context slices ontology logical pattern</rdfs:label>
  <owl:versionInfo xml:lang="en">1.0</owl:versionInfo>
</owl:Ontology>
<owl:Class rdf:about="ContextualProjection">
  <rdfs:comment rdf:datatype="&xsd;string">A contextual projection or slice of an entity or event.
The context defines the contextual extent of the slice. If any relations hold in a context, they must be to other slices of the same context (there is no way to enforce this constraint in OWL).
  </rdfs:comment>
  <rdfs:subClassOf>
    <owl:Restriction>
      <owl:cardinality rdf:datatype="&xsd;nonNegativeInteger">1</owl:cardinality>
      <owl:onProperty rdf:resource="#hasContext"/>
    </owl:Restriction>
  </rdfs:subClassOf>
  <rdfs:subClassOf>
    <owl:Restriction>
      <owl:cardinality rdf:datatype="&xsd;nonNegativeInteger">1</owl:cardinality>
      <owl:onProperty rdf:resource="#projectionOf"/>
    </owl:Restriction>
  </rdfs:subClassOf>
  <rdfs:subClassOf>
    <owl:Restriction>
      <owl:allValuesFrom rdf:resource="Context"/>
      <owl:onProperty rdf:resource="#hasContext"/>
    </owl:Restriction>
  </rdfs:subClassOf>
  <owl:disjointWith rdf:resource="Context"/>
</owl:Class>
<owl:Class rdf:about="Context">
  <rdfs:comment rdf:datatype="&xsd;string">It is intended that this class should be equated with whatever class represents contexts, with possibly subclasses for different kinds such as BeliefContext, TemporalInterval, etc.</rdfs:comment>
  <owl:disjointWith rdf:resource="#ContextualProjection"/>
</owl:Class>
<owl:ObjectProperty rdf:about="#contextualProperty">
  <rdfs:comment rdf:datatype="&xsd;string">A property that holds in a context.</rdfs:comment>
  <rdflib:domain rdf:resource="#ContextualProjection"/>
  <rdflib:range rdf:resource="#ContextualProjection"/>
</owl:ObjectProperty>
<owl:FunctionalProperty rdf:about="#hasContext">
  <rdf:type rdf:resource="&owl;ObjectProperty"/>
  <rdfs:comment rdf:datatype="&xsd;string">The relation from a ContextualProjection to the context in which some property holds</rdfs:comment>
  <rdflib:domain rdf:resource="#ContextualProjection"/>
</owl:FunctionalProperty>
<owl:FunctionalProperty rdf:about="#projectionOf">
  <rdf:type rdf:resource="&owl;ObjectProperty"/>
  <rdfs:comment rdf:datatype="&xsd;string">The entity or event that a context slice is a slice of.</rdfs:comment>
  <rdflib:domain rdf:resource="#ContextualProjection"/>
</owl:FunctionalProperty>
</rdf:RDF>
```

Scénario#1

On reprend l'ontologie précédente en stipulant que le radio réveil est localisé dans la cuisine entre 14h et 19h. **La propriété dynamique est ici la localisation des dispositifs.**

```

<!-- Contextual property definition -->
<owl:ObjectProperty rdf:ID="hasLocation">
  <rdfs:subPropertyOf>
    <owl:ObjectProperty
      rdf:ID="contextualProperty">
        </rdfs:subPropertyOf>
    </owl:ObjectProperty>
<!-- Contexts definition -->
<AlarmClock rdf:ID="AlarmClock_1">
  <IsA rdf:resource="#SoundSource"/>
</AlarmClock>
...
<owl:Instant rdf:ID="i1">
  <owl:inXSDDateTime
    rdf:datatype="http://www.w3.org/2001/XMLSchema#time">
    >14:00:00</owl:inXSDDateTime>
  </owl:Instant>
<owl:Instant rdf:ID="i2">
  <owl:inXSDDateTime
    rdf:datatype="http://www.w3.org/2001/XMLSchema#time">
    >19:00:00</owl:inXSDDateTime>
  </owl:Instant>
<owl:ProperInterval rdf:ID="timeSlice_1">
  <owl:hasBeginning rdf:resource="#i1"/>
  <owl:hasEnd rdf:resource="#i2"/>
</owl:ProperInterval>
<TemporalContext rdf:ID="context_1">
  <hasTimeSlice rdf:resource="#timeSlice_1"/>
</TemporalContext>
<ContextualProjection rdf:about="#Kitchen$context_1">
  <hasContext rdf:resource="#context_1"/>
  <projectionOf rdf:resource="#Kitchen"/>
</ContextualProjection>
<ContextualProjection rdf:about="#AlarmClock_1$context_1">
  <hasContext rdf:resource="#context_1"/>
  <hasLocation rdf:resource="#Kitchen$context_1"/>
  <projectionOf rdf:resource="#AlarmClock_1"/>
</ContextualProjection>

```

On peut alors faire une requête sparql pour extraire les dispositifs qui se trouvent à un endroit donné dans une intervalle de temps donnée (par exemple les dispositifs dans la cuisine):

SPARQL query:

```

PREFIX rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
PREFIX owl: <http://www.w3.org/2002/07/owl#>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
PREFIX xsd: <http://www.w3.org/2001/XMLSchema#>
PREFIX owl: <http://www.w3.org/2006/time#>
PREFIX tst: <http://www.owl-ontologies.com/MyOntology.owl#>
SELECT ?Device ?time ?begin ?end ?location
WHERE { ?subject tst:hasLocation ?locationContext .
?locationContext tst:projectionOf ?location .
?subject tst:projectionOf ?Device .
?subject tst:hasContext ?context .
?context tst:hasTimeSlice ?time .
?time owl:hasBeginning ?b .
?time owl:hasEnd ?e .
?b owl:inXSDDateTime ?begin .
?e owl:inXSDDateTime ?end .
FILTER(?location = tst:Kitchen && ?begin > "09:00:00"^^<http://www.w3.org/2001/XMLSchema#time> && ?end > "15:45:00"^^<http://www.w3.org/2001/XMLSchema#time>)
}

```

Device	time	begin	end	location
AlarmClock_1	timeSlice_1	"14:00:00"^^<http://www.w3.org/2001/XMLSchema#time>	"19:00:00"^^<http://www.w3.org/2001/XMLSchema#time>	tst:Kitchen

Execute

On retrouve bien AlarmClock_1 qui est dans ce cas.

La requête est assez complexe mais il existe la fonction now() de SPARQL qui permet de retourner l'heure à laquelle est effectuée la requête. Il suffit de comparer les heures de start/end des timeslices avec l'heure retournée par now() pour avoir la liste des dispositifs disponibles au moment de la requête.

Cette fonction ne marche pas dans protégé ☺ je n'ai donc pas pu l'essayer.

Dans un autre contexte temporel ou aucun dispositif est valide (par ex. Entre 19h et 22h45), on obtient rien:

SPARQL query:

```

PREFIX rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
PREFIX owl: <http://www.w3.org/2002/07/owl#>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
PREFIX xsd: <http://www.w3.org/2001/XMLSchema#>
PREFIX owl: <http://www.w3.org/2006/time#>
PREFIX tst: <http://www.owl-ontologies.com/MyOntology.owl#>
SELECT ?Device ?time ?begin ?end ?location
WHERE { ?subject tst:hasLocation ?locationContext .
?locationContext tst:projectionOf ?location .
?subject tst:projectionOf ?Device .
?subject tst:hasContext ?context .
?context tst:hasTimeSlice ?time .
?time owl:hasBeginning ?b .
?time owl:hasEnd ?e .
?b owl:inXSDDateTime ?begin .
?e owl:inXSDDateTime ?end .
FILTER(?location = tst:Kitchen && ?begin > "19:00:00"^^<http://www.w3.org/2001/XMLSchema#time> && ?end > "22:45:00"^^<http://www.w3.org/2001/XMLSchema#time>)
}

```

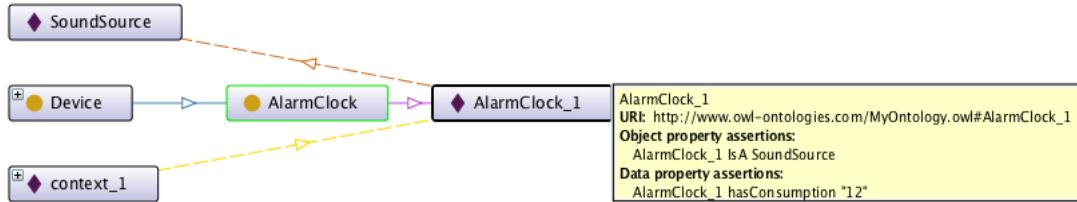

Device	time	begin	end	location
--------	------	-------	-----	----------

Execute

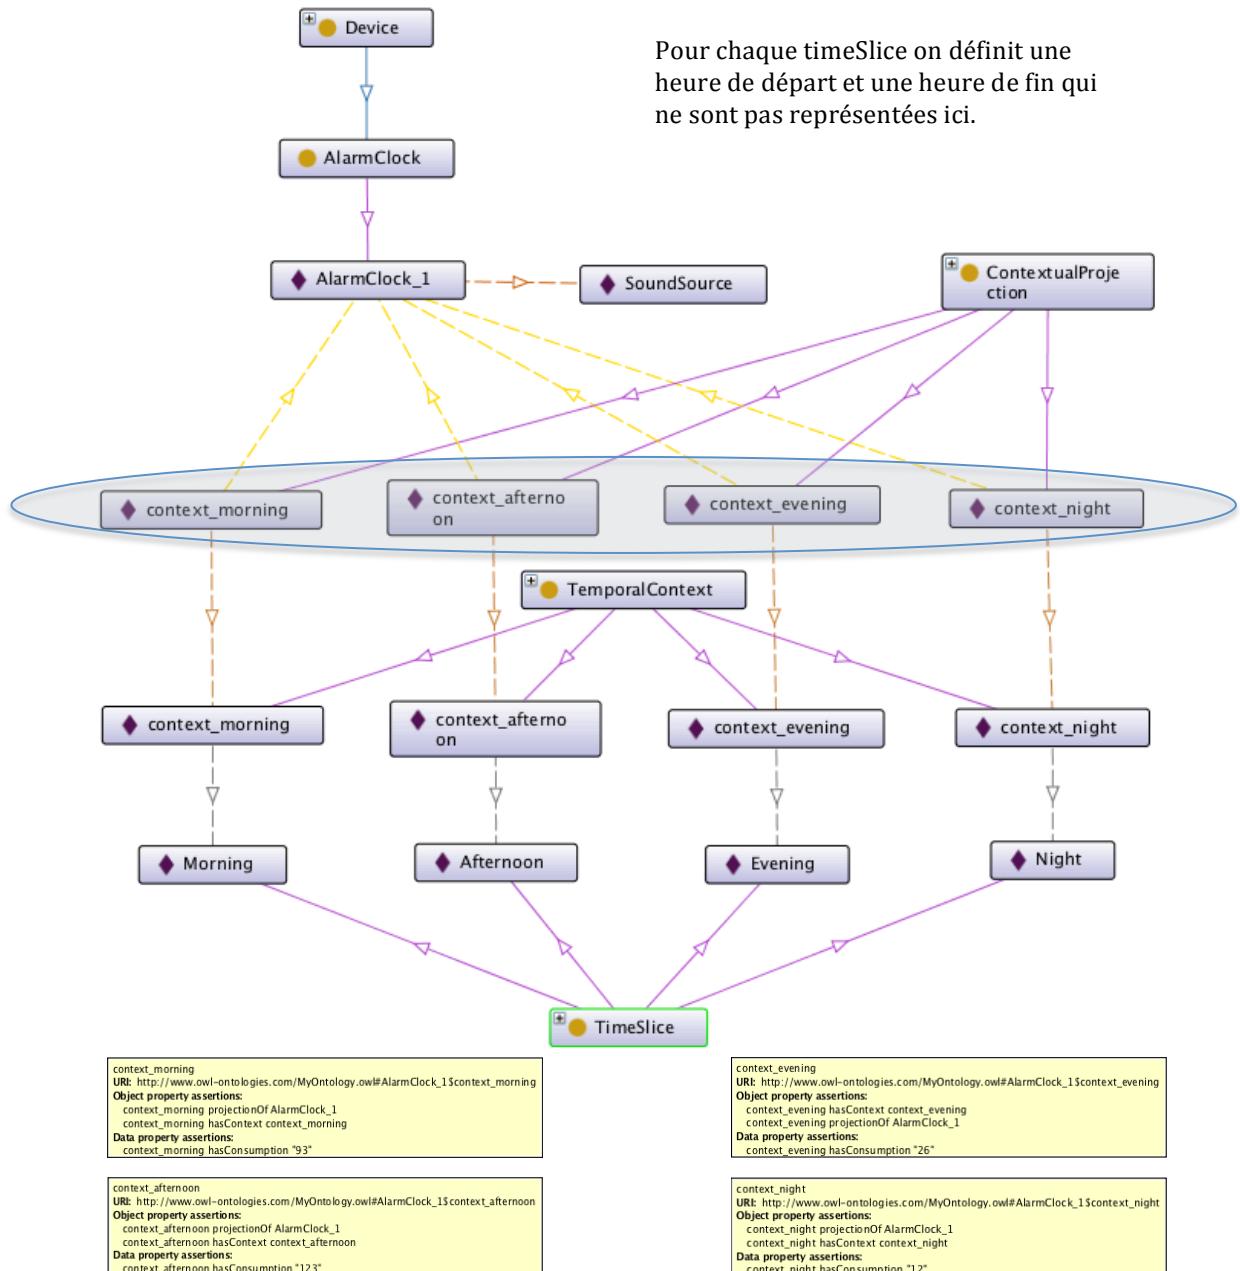

Scénario#2

Dans ce scénario, on considère que les dispositifs n'ont pas la même consommation électrique selon le moment dans la journée.

Par exemple, on peut considérer que le réveil (ok, c'est un peu idiot ☺) a une consommation électrique fixe (ici 12)

On peut très bien rendre la propriété 'hasConsommation' dynamique en fonction des moments dans la journée en la contextualisant:

```

...
<!-- Contextual property definition -->
<owl:ObjectProperty rdf:ID="hasConsumption">
  <rdfs:range rdf:resource="#xsd:unsignedInt"/>
  <rdfs:subPropertyOf>
    <owl:ObjectProperty rdf:ID="contextualProperty"/>
  </rdfs:subPropertyOf>
</owl:ObjectProperty>
...
<!-- Pre-defined time slices -->

<owl:Instant rdf:ID="Night_start">
  <owlt:inXSDDateTime>22:00:00</owlt:inXSDDateTime>
</owl:Instant>
<owl:Instant rdf:ID="Night_end">
  <owlt:inXSDDateTime>08:00:00</owlt:inXSDDateTime>
</owl:Instant>

<owl:Instant rdf:ID="Morning_start">
  <owlt:inXSDDateTime>08:00:01</owlt:inXSDDateTime>
</owl:Instant>
<owl:Instant rdf:ID="Morning_end">
  <owlt:inXSDDateTime>11:59:59</owlt:inXSDDateTime>
</owl:Instant>

<owl:Instant rdf:ID="Afternoon_start">
  <owlt:inXSDDateTime>12:00:00</owlt:inXSDDateTime>
</owl:Instant>
<owl:Instant rdf:ID="Afternoon_end">
  <owlt:inXSDDateTime>17:59:59</owlt:inXSDDateTime>
</owl:Instant>

<owl:Instant rdf:ID="Evening_start">
  <owlt:inXSDDateTime>18:00:00</owlt:inXSDDateTime>
</owl:Instant>
<owl:Instant rdf:ID="Evening_end">
  <owlt:inXSDDateTime>21:59:59</owlt:inXSDDateTime>
</owl:Instant>

<owl:TimeSlice rdf:ID="Night">
  <owl:hasBeginning rdf:resource="#Night_start"/>
  <owl:hasEnd rdf:resource="#Night_end"/>
</owl:TimeSlice>

<owl:TimeSlice rdf:ID="Morning">
  <owl:hasBeginning rdf:resource="#Morning_start"/>
  <owl:hasEnd rdf:resource="#Morning_end"/>
</owl:TimeSlice>

<owl:TimeSlice rdf:ID="Afternoon">
  <owl:hasBeginning rdf:resource="#Afternoon_start"/>
  <owl:hasEnd rdf:resource="#Afternoon_end"/>
</owl:TimeSlice>

<owl:TimeSlice rdf:ID="Evening">
  <owl:hasBeginning rdf:resource="#Evening_start"/>
  <owl:hasEnd rdf:resource="#Evening_end"/>
</owl:TimeSlice>
...
<!-- Contexts definition -->
<AlarmClock rdf:ID="AlarmClock_1">
  <IsA rdf:resource="#SoundSource"/>
</AlarmClock>

<TemporalContext rdf:ID="context_night">
  <hasTimeSlice rdf:resource="#Night"/>
</TemporalContext>

<TemporalContext rdf:ID="context_evening">
  <hasTimeSlice rdf:resource="#Evening"/>
</TemporalContext>

<TemporalContext rdf:ID="context_afternoon">
  <hasTimeSlice rdf:resource="#Afternoon"/>
</TemporalContext>

<TemporalContext rdf:ID="context_morning">
  <hasTimeSlice rdf:resource="#Morning"/>
</TemporalContext>

<ContextualProjection
rdf:about="#AlarmClock_1$context_night">
  <hasContext rdf:resource="#context_night"/>
  <hasConsumption>12</hasConsumption>
  <projectionOf rdf:resource="#AlarmClock_1"/>
</ContextualProjection>

<ContextualProjection
rdf:about="#AlarmClock_1$context_morning">
  <hasContext rdf:resource="#context_morning"/>
  <hasConsumption>93</hasConsumption>
  <projectionOf rdf:resource="#AlarmClock_1"/>
</ContextualProjection>

<ContextualProjection
rdf:about="#AlarmClock_1$context_afternoon">
  <hasContext rdf:resource="#context_afternoon"/>
  <hasConsumption>123</hasConsumption>
  <projectionOf rdf:resource="#AlarmClock_1"/>
</ContextualProjection>

<ContextualProjection
rdf:about="#AlarmClock_1$context_evening">
  <hasContext rdf:resource="#context_evening"/>
  <hasConsumption>26</hasConsumption>
  <projectionOf rdf:resource="#AlarmClock_1"/>
</ContextualProjection>

```

On peut alors faire une requête SPARQL pour demander les dispositifs qui consomment le moins dans une tranche horaire donnée:

Par exemple, nous avons deux dispositifs qui consomment différemment en fonction de la tranche horaire (ontologie vue précédemment):

The screenshot shows the Protege 5.0 interface with the 'SPARQL Query' tab selected. The query results table displays consumption data for various devices over different time periods. The columns are 'Device', 'consommation' (labeled 'cons' in the screenshot), 'time', 'begin', and 'end'. The data shows two devices, TV_1 and AlarmClock_1, with their consumption values and corresponding time intervals.

Device	consommation	time	begin	end
TV_1	"26"^^<http://www.w3.org/2001/XMLSchema#int>	Evening	"18:00:00"^^<http://www.w3.org/2001/XMLSchema#time>	"21:59:59"^^<http://www.w3.org/2001/XMLSchema#time>
TV_1	"126"^^<http://www.w3.org/2001/XMLSchema#int>	Evening	"18:00:00"^^<http://www.w3.org/2001/XMLSchema#time>	"21:59:59"^^<http://www.w3.org/2001/XMLSchema#time>
AlarmClock_1	"123"^^<http://www.w3.org/2001/XMLSchema#int>	Afternoon	"12:00:00"^^<http://www.w3.org/2001/XMLSchema#time>	"17:59:59"^^<http://www.w3.org/2001/XMLSchema#time>
AlarmClock_1	"93"^^<http://www.w3.org/2001/XMLSchema#int>	Morning	"08:00:01"^^<http://www.w3.org/2001/XMLSchema#time>	"11:59:59"^^<http://www.w3.org/2001/XMLSchema#time>
TV_1	"3"^^<http://www.w3.org/2001/XMLSchema#int>	Morning	"08:00:01"^^<http://www.w3.org/2001/XMLSchema#time>	"11:59:59"^^<http://www.w3.org/2001/XMLSchema#time>
AlarmClock_1	"12"^^<http://www.w3.org/2001/XMLSchema#int>	Night	"22:00:00"^^<http://www.w3.org/2001/XMLSchema#time>	"08:00:00"^^<http://www.w3.org/2001/XMLSchema#time>
TV_1	"354"^^<http://www.w3.org/2001/XMLSchema#int>	Night	"22:00:00"^^<http://www.w3.org/2001/XMLSchema#time>	"08:00:00"^^<http://www.w3.org/2001/XMLSchema#time>

Maintenant on souhaite obtenir les dispositifs qui consomment moins de 15W entre 06h43 et 15h45:

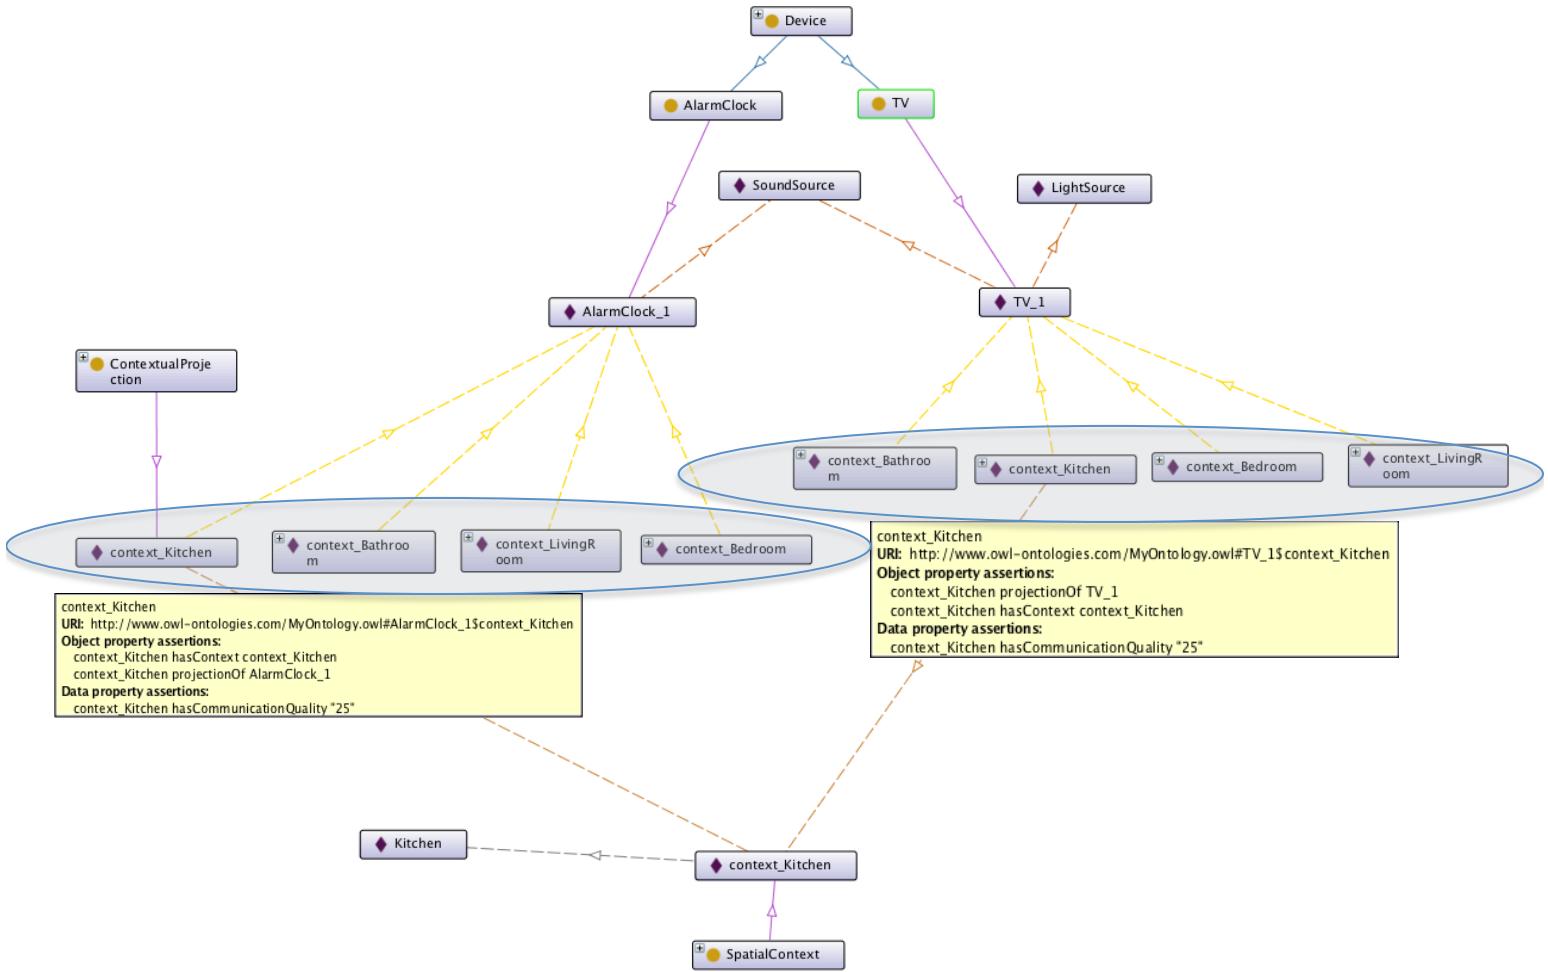

Seulement 2 dispositifs correspondent :

The screenshot shows the Protege 5.0 interface with the 'SPARQL Query' tab selected. A new filter has been added to the query to restrict results to devices with consumption less than 15W between 06:43 and 15:45. The results table shows that only two devices, TV_1 and AlarmClock_1, meet these criteria.

Device	consommation	time	begin	end
TV_1	"3"^^<http://www.w3.org/2001/XMLSchema#int>	Morning	"08:00:01"^^<http://www.w3.org/2001/XMLSchema#time>	"11:59:59"^^<http://www.w3.org/2001/XMLSchema#time>
AlarmClock_1	"12"^^<http://www.w3.org/2001/XMLSchema#int>	Night	"22:00:00"^^<http://www.w3.org/2001/XMLSchema#time>	"08:00:00"^^<http://www.w3.org/2001/XMLSchema#time>

Scénario#3

Dans ce scénario on considère que le taux de qualité de communication avec les dispositifs est fonction de l'endroit où ils se situent. La propriété dynamique va donc être la qualité de communication que l'on va contextualiser en fonction localisation des différents dispositifs: (Ca permet de faire des requêtes du type : "Je suis dans le salon, donne moi les services avec lesquels la qualité de communication est > 23").

```

...
<!-- Contextual property definition -->
<owl:ObjectProperty rdf:ID="hasCommunicationQuality">
  <rdfs:range rdf:resource="#xsd:unsignedByte"/>
  <rdfs:subPropertyOf>
    <owl:ObjectProperty rdf:ID="contextualProperty"/>
  </rdfs:subPropertyOf>
</owl:ObjectProperty>...

<owl:ObjectProperty rdf:ID="hasSpaceSlice">
  <rdfs:range rdf:resource="#SpaceSlice"/>
  <rdfs:domain rdf:resource="#SpatialContext"/>
</owl:ObjectProperty>
...

<!-- Contexts definition -->
<AlarmClock rdf:ID="AlarmClock_1">
  <IsA rdf:resource="#SoundSource"/>
</AlarmClock>

<TV rdf:ID="TV_1">
  <IsA rdf:resource="#SoundSource"/>
  <IsA rdf:resource="#LightSource"/>
</TV>

<SpatialContext rdf:ID="context_Kitchen">
  <hasSpaceSlice rdf:resource="#Kitchen"/>
</SpatialContext>

<SpatialContext rdf:ID="context_LivingRoom">
  <hasSpaceSlice rdf:resource="#LivingRoom"/>
</SpatialContext>

<SpatialContext rdf:ID="context_Bedroom">
  <hasSpaceSlice rdf:resource="#Bedroom"/>
</SpatialContext>

<SpatialContext rdf:ID="context_Bathroom">
  <hasSpaceSlice rdf:resource="#Bathroom"/>
</SpatialContext>

<ContextualProjection rdf:about="#AlarmClock_1$context_Kitchen">
  <hasContext rdf:resource="#context_Kitchen"/>
  <hasCommunicationQuality>25</hasCommunicationQuality>
  <projectionOf rdf:resource="#AlarmClock_1"/>
</ContextualProjection>

<ContextualProjection rdf:about="#AlarmClock_1$context_LivingRoom">
  <hasContext rdf:resource="#context_LivingRoom"/>
  <hasCommunicationQuality>112</hasCommunicationQuality>
  <projectionOf rdf:resource="#AlarmClock_1"/>
</ContextualProjection>

<ContextualProjection rdf:about="#AlarmClock_1$context_Bedroom">
  <hasContext rdf:resource="#context_Bedroom"/>
  <hasCommunicationQuality>255</hasCommunicationQuality>
  <projectionOf rdf:resource="#AlarmClock_1"/>
</ContextualProjection>

<ContextualProjection rdf:about="#AlarmClock_1$context_Bathroom">
  <hasContext rdf:resource="#context_Bathroom"/>
  <hasCommunicationQuality>6</hasCommunicationQuality>
  <projectionOf rdf:resource="#AlarmClock_1"/>
</ContextualProjection>

<ContextualProjection rdf:about="#TV_1$context_Kitchen">
  <hasContext rdf:resource="#context_Kitchen"/>
  <hasCommunicationQuality>25</hasCommunicationQuality>
  <projectionOf rdf:resource="#TV_1"/>
</ContextualProjection>

<ContextualProjection rdf:about="#TV_1$context_LivingRoom">
  <hasContext rdf:resource="#context_LivingRoom"/>
  <hasCommunicationQuality>255</hasCommunicationQuality>
  <projectionOf rdf:resource="#TV_1"/>
</ContextualProjection>

<ContextualProjection rdf:about="#TV_1$context_Bedroom">
  <hasContext rdf:resource="#context_Bedroom"/>
  <hasCommunicationQuality>76</hasCommunicationQuality>
  <projectionOf rdf:resource="#TV_1"/>
</ContextualProjection>

<ContextualProjection rdf:about="#TV_1$context_Bathroom">
  <hasContext rdf:resource="#context_Bathroom"/>
  <hasCommunicationQuality>1</hasCommunicationQuality>
  <projectionOf rdf:resource="#TV_1"/>
</ContextualProjection>

```

On peut alors faire des requêtes SPARQL pour retourner tous les dispositifs et leur qualité de communication dans chacune des locations:

The screenshot shows the Protege 5.0 interface with the 'SPARQL Query' tab selected. A SPARQL query is entered in the query editor:

```

PREFIX rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
PREFIX owl: <http://www.w3.org/2002/07/owl#>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
PREFIX xsd: <http://www.w3.org/2001/XMLSchema#>
PREFIX tst: <http://www.example.org/MyOntology.owl#>
SELECT ?Device ?CommunicationQuality ?location
WHERE { ?subject tst:hasCommunicationQuality ?CommunicationQuality .
      ?subject tst:projectionOf ?Device .
      ?subject tst:hasContext ?context .
      ?context tst:hasSpaceSlice ?location . }
ORDER BY (?CommunicationQuality)
  
```

The results table displays the following data:

Device	CommunicationQuality	location
TV_1	"1"^^<http://www.w3.org/2001/XMLSchema#int>	Bathroom
AlarmClock_1	"6"^^<http://www.w3.org/2001/XMLSchema#int>	Bathroom
TV_1	"25"^^<http://www.w3.org/2001/XMLSchema#int>	Kitchen
AlarmClock_1	"25"^^<http://www.w3.org/2001/XMLSchema#int>	Kitchen
TV_1	"76"^^<http://www.w3.org/2001/XMLSchema#int>	Bedroom
AlarmClock_1	"112"^^<http://www.w3.org/2001/XMLSchema#int>	LivingRoom
AlarmClock_1	"255"^^<http://www.w3.org/2001/XMLSchema#int>	Bedroom
TV_1	"255"^^<http://www.w3.org/2001/XMLSchema#int>	LivingRoom

At the bottom right of the interface, there are buttons for 'Reasoner active' and 'Show Inferences'.

Ok, tout y est!

Maintenant, on sélectionne les dispositifs qui ont une qualité de communication > 150 dans le salon:

The screenshot shows the Protege 5.0 interface with the 'SPARQL Query' tab selected. A refined SPARQL query is entered in the query editor:

```

PREFIX rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
PREFIX owl: <http://www.w3.org/2002/07/owl#>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
PREFIX xsd: <http://www.w3.org/2001/XMLSchema#>
PREFIX tst: <http://www.example.org/MyOntology.owl#>
SELECT ?Device ?CommunicationQuality ?location
WHERE { ?subject tst:hasCommunicationQuality ?CommunicationQuality .
      ?subject tst:projectionOf ?Device .
      ?subject tst:hasContext ?context .
      ?context tst:hasSpaceSlice ?location .
      FILTER(?CommunicationQuality > 150 && ?location=tst:LivingRoom) . }
ORDER BY (?CommunicationQuality)
  
```

The results table displays the following data:

Device	CommunicationQuality	location
TV_1	"255"^^<http://www.w3.org/2001/XMLSchema#int>	LivingRoom

At the bottom right of the interface, there are buttons for 'Reasoner active' and 'Show Inferences'.

Seule la TV_1 répond à cette contrainte.

Appendix : Règles d'inférence

Les règles utilisent la convention suivante :

aaa, bbb, etc... : URI référence (tous les prédictats possibles d'un triplet)
 uuu, vvv, etc... : Identifiant de ref. d'URI ou de blank node, (sujets possibles d'un triplet)
 xxx,yyy etc... : URI référence, blank node identifier ou littéral (sujet ou objet d'un triplet)
 III : Un littéral;
 _:nnn, etc... : Blank node identifiers.

Par défaut il existe les règles d'inférence suivantes:

literal generalization rule.

Rule Name	If E contains	then add
lg	uuu aaa III .	uuu aaa _:nnn . where _:nnn identifies a blank node allocated to the literal III by this rule.

literal instantiation rule.

Rule Name	If E contains	then add
gl	uuu aaa _:nnn . where _:nnn identifies a blank node allocated to the literal III by rule lg.	uuu aaa III .

RDF entailment rules

Rule Name	If E contains	then add
rdf1	uuu aaa yyy .	aaa rdf:type rdf:Property .
rdf2	uuu aaa III . where III is a well-typed XML literal .	_:nnn rdf:type rdf:XMLLiteral . where _:nnn identifies a blank node allocated to III by rule lg.

RDFS entailment rules.

Rule Name	If E contains:	then add:
rdfs1	uuu aaa III . where III is a plain literal (with or without a language tag).	_:nnn rdf:type rdfs:Literal . where _:nnn identifies a blank node allocated to III by rule lg.
rdfs2	aaa rdfs:domain xxx . uuu aaa yyy .	uuu rdf:type xxx .
rdfs3	aaa rdfs:range xxx . uuu aaa vvv .	vvv rdf:type xxx .
rdfs4a	uuu aaa xxx .	uuu rdf:type rdfs:Resource .
rdfs4b	uuu aaa vvv .	vvv rdf:type rdfs:Resource .
rdfs5	uuu rdfs:subPropertyOf vvv . vvv rdfs:subPropertyOf xxx .	uuu rdfs:subPropertyOf xxx .
rdfs6	uuu rdf:type rdf:Property .	uuu rdfs:subPropertyOf uuu .
rdfs7	aaa rdfs:subPropertyOf bbb . uuu aaa yyy .	uuu bbb yyy .
rdfs8	uuu rdf:type rdfs:Class .	uuu rdfs:subClassOf rdfs:Resource .
rdfs9	uuu rdfs:subClassOf xxx . vvv rdf:type uuu .	vvv rdf:type xxx .
rdfs10	uuu rdf:type rdfs:Class .	uuu rdfs:subClassOf uuu .
rdfs11	uuu rdfs:subClassOf vvv . vvv rdfs:subClassOf xxx .	uuu rdfs:subClassOf xxx .
rdfs12	uuu rdf:type rdfs:ContainerMembershipProperty .	uuu rdfs:subPropertyOf rdfs:member .
rdfs13	uuu rdf:type rdfs:Datatype .	uuu rdfs:subClassOf rdfs:Literal .

Additional inferences which would be valid under the extensional versions of the RDFS semantic conditions.

ext1	uuu rdfs:domain vvv . vvv rdfs:subClassOf zzz .	uuu rdfs:domain zzz .
ext2	uuu rdfs:range vvv . vvv rdfs:subClassOf zzz .	uuu rdfs:range zzz .
ext3	uuu rdfs:domain vvv . www rdfs:subPropertyOf uuu .	www rdfs:domain vvv .
ext4	uuu rdfs:range vvv . www rdfs:subPropertyOf uuu .	www rdfs:range vvv .
ext5	rdf:type rdfs:subPropertyOf www . www rdfs:domain vvv .	rdfs:Resource rdfs:subClassOf vvv .
ext6	rdfs:subClassOf rdfs:subPropertyOf www . www rdfs:domain vvv .	rdfs:Class rdfs:subClassOf vvv .
ext7	rdfs:subPropertyOf rdfs:subPropertyOf www . www rdfs:domain vvv .	rdf:Property rdfs:subClassOf vvv .
ext8	rdfs:subClassOf rdfs:subPropertyOf www . www rdfs:range vvv .	rdfs:Class rdfs:subClassOf vvv .
ext9	rdfs:subPropertyOf rdfs:subPropertyOf www . www rdfs:range vvv .	rdf:Property rdfs:subClassOf vvv .

rdfD1	<code>ddd rdf:type rdfs:Datatype .</code> uuu aaa "sss"^^ddd .	<code>_:nnn rdf:type ddd .</code> where _:nnn identifies a blank node allocated to "sss"^^ddd by rule rule lg.
rdfD2	<code>ddd rdf:type rdfs:Datatype .</code> uuu aaa "sss"^^ddd .	uuu aaa "ttt"^^ddd .
rdfD3	<code>ddd rdf:type rdfs:Datatype .</code> <code>eee rdf:type rdfs:Datatype .</code> uuu aaa "sss"^^ddd .	uuu aaa "ttt"^^eee .
xsd 1a	uuu aaa "sss".	uuu aaa "sss"^^xsd:string .
xsd 1b	uuu aaa "sss"^^xsd:string .	uuu aaa "sss".

On peut ajouter des règles d'inférence 'custom' grâce à SWRL (Semantic Web Rule Language). Par exemple, si on reprend le scenario 2 et qu'on souhaite inférer que si A *projectionOf* B alors B *hasProjection* A (exemple simple de symétrie mais qui permet de facilement retrouver tous les contextes d'un objet. A sa disparition, on efface les contextes (propriétés dynamiques), pas ses propriétés statiques). **Nécessite un raisonneur qui comprenne SWRL (Pellet par exemple)**

Modification de l'ontologie:

```
<swrl:Variable rdf:ID="x1"/>
<swrl:Variable rdf:ID="x2"/>
<swrl:Imp>
  <swrl:body rdf:parseType="Collection">
    <swrl:IndividualPropertyAtom>
      <swrl:propertyPredicate rdf:resource="#projectionOf"/>
      <swrl:argument1 rdf:resource="#x1"/>
      <swrl:argument2 rdf:resource="#x2"/>
    </swrl:IndividualPropertyAtom>
  </swrl:body>
  <swrl:head rdf:parseType="Collection">
    <swrl:IndividualPropertyAtom>
      <swrl:propertyPredicate rdf:resource="#hasProjection"/>
      <swrl:argument1 rdf:resource="#x2"/>
      <swrl:argument2 rdf:resource="#x1"/>
    </swrl:IndividualPropertyAtom>
  </swrl:head>
</swrl:Imp>
```

On obtient , après exécution du raisonneur de nouveaux faits inférés:

The screenshot shows the Protege 5.0 interface with the following details:

- Class hierarchy:** TV is a subclass of Thing. It also has Context, ContextualProjection, Device, DeviceType, Instant, Int, Location, ProperInterval, TimeSlice, and User as subclasses.
- Annotations:** TV_1 has an annotation for the predicate `hasProjection` pointing to context_afternoon, context_morning, context_evening, and context_night.
- Description:** TV is a type of TV.
- Property assertions:** TV is asserted to be a LightSource and SoundSource. It also has projection assertions for context_afternoon, context_morning, context_evening, and context_night.

Etendre les fonctionnalités de SPARQL (Ajout d'opérateurs)

On se base sur Jena qui est utilisé dans Conquer.

https://www.google.fr/url?sa=t&rct=j&q=&esrc=s&source=web&cd=2&ved=0CCgQFjAB&url=https%3A%2F%2Fjena.apache.org%2Fdocumentation%2Fquery%2Fwriting_functions.html&ei=EDGEVKDrHsS2UY3SgRA&usg=AFQjCNHkm39QgmPdYsHNuwXYZKerqVfVQ&sig2=EX9VG20T3OR8CtMwD1Gt6g&bvm=bv.80642063,d.d24
